

Growing material, not dividing particles

A sampling-aware model for morphogenesis with MPM

SAMPLE-DRIVEN GROWTH

Every nearby point makes its own growth decision.

More samples can accidentally mean more growth.

FIELD-INTEGRATED GROWTH

The material decides once. Samples follow.

CORE PRINCIPLE

Biology controls continuum growth. Particle creation only maintains numerical coverage.

Nearby intentions are averaged, persistent growth credit belongs to space, and target claims prevent duplicate insertion.

FIELD-INTEGRATED MATERIAL GROWTH
